# Introduction

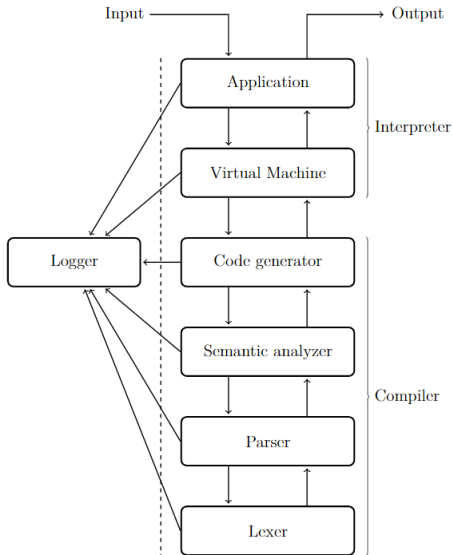

---

## 1.1 Introduction: Objectives

### MAIN OBJECTIVES

- Design an experimental programming language.
- Build a compiler and an interpreter for the language.
- Use a robust system architecture.
- Build a small standard library.

## 1.2 Introduction: System Architecture

## 1.3 Introduction: The Nuua Programming Language

### What is Nuua?

Nuua is a general-purpose high level programming language with an imperative paradigm and a statically typed system.

```
fun main(argv: [string]) {  
    print "Hello, World"  
}
```

## 1.3 Introduction: The Nuua Programming Language

```
class Triangle {  
    b: float  
    h: float  
    fun area(): float -> (self.b * self.h) / 2.0  
}  
  
fun main(argv: [string]) {  
    t := Triangle!{b: 10.0, h: 5.0}  
    print "The area is: " + t.area() as string  
}
```

## 1.3 Introduction: The Nuua Programming Language

```
fun rec_fib(n: int): int {  
    if n < 2 => return n  
    return rec_fib(n - 2) + rec_fib(n - 1)  
}  
  
fun main(argv: [string]) {  
    print rec_fib(25)  
}
```

## 1.4 Introduction: Error Logging

```
> C:\Presentation\code\high.nu, line: 3, column: 1
  Parsing 'class' declaration
  class Collection whops {
  ^

> C:\Presentation\code\high.nu, line: 3, column: 18
  Expected '{' after 'class' name.
  class Collection whops {
  ^
```

**Figure 1** – Example of error logging

# Lexical Analysis

---

## 2.1 Lexical Analysis: Scanning the Source File

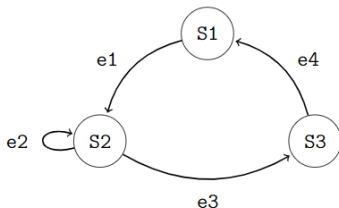

### Lexical Analysis

Transform a list of characters found in the source file into a list of tokens defined in the language.

**Figure 2** – Lexical analysis overview

## 2.1 Lexical Analysis: Scanning the Source File

(i) Diagram

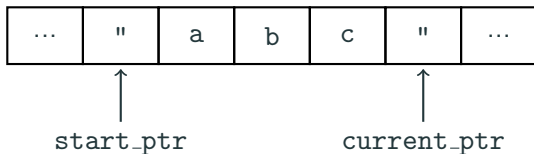

State	Explanation	Event	Condition	Action
S1	Initial state of the state machine.	e1	<code>c == '"'</code>	<code>c = next_char()</code>
		e2	<code>c != '"'</code>	<code>c = next_char()</code>
S2	Build string. <code>s += c</code>	e3	<code>c == '"'</code>	-
S3	Create token	e4	-	<code>c = next_char()</code>

(ii) State table

(iii) Event table

**Figure 3** – Example finite state machine for strings

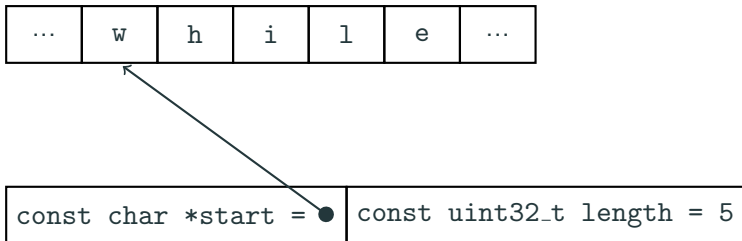

## 2.1 Lexical Analysis: Scanning the Source File

**Figure 4** – Lexer scan technique

$$\text{length} = \text{current\_ptr} - \text{start\_ptr} + 1$$

## 2.1 Lexical Analysis: Scanning the Source File

**Figure 5** – Token instance

# Syntactic Analysis

---

## 3.1 Syntactic Analysis: Technique

### Syntactic Analysis

Transform the list of tokens returned by the Lexer into an abstract syntax tree.

**Figure 6** – Parser overview

## 3.1 Syntactic Analysis: Technique

MUST BE

- Controlable (for error reporting).
- Easy to build.
- Fast enough.
- Handwritten (no generators).

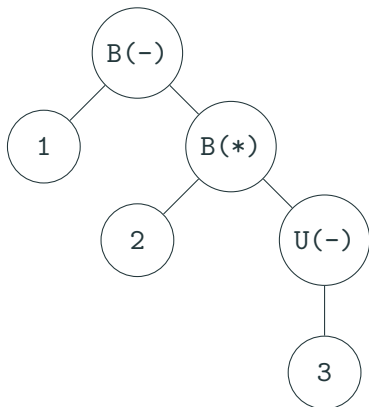

CANDIDATES

- **Top-down recursive descend predictive parser.**
- Pratt parser (top-down operator-precedence parser).

## 3.2 Syntactic Analysis: Abstract Syntax Tree

1 - 2 \* -3

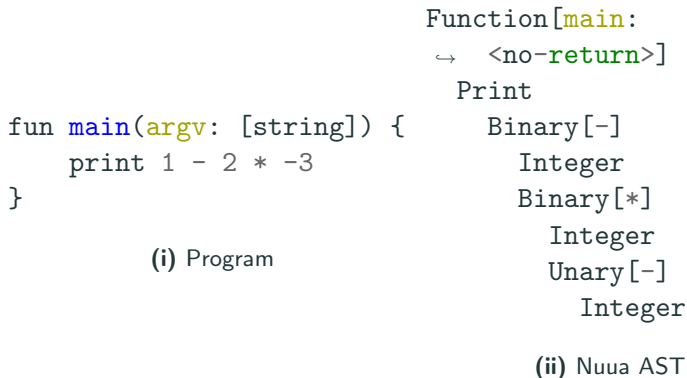

(i) Program

(ii) Nuua AST

**Figure 7** – Example abstract syntax tree

## 3.2 Syntactic Analysis: Abstract Syntax Tree

**Figure 8** – Code example abstract syntax tree

# Semantic Analysis

---

## 4.1 Semantic Analysis: Safety Checks

### Semantic Analysis

Append information to the AST and perform checks to ensure it's a valid program. If this checks succeed, the program is considered valid.

#### IMPLEMENTED

- Creation of the symbol table for each module and block scope.
- Expression type inference.
- Static type checking.
- Node information attachment.

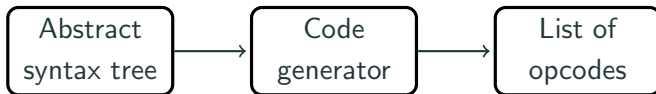

# Code Generation

---

## 5.1 Code Generation: Instructions

### Code Generator

Transforms the AST into bytecode instructions ready to be executed by the virtual machine.

**Figure 9** – Code generator overview

## 5.1 Code Generation: Instructions

### IMPLEMENTED

- Bytecode instructions similar to hardware instructions.
- 113 register-based instructions.
- Constant pool and globals creation.
- Frame sizes (registers needed).
- Optimizations

# Optimizations

---

## 6.1 Optimizations: Constant Folding

### IMPLEMENTED

- Very basic constant folding on lists and dictionaries.

### IMPROVEMENT

- Reduce the number of opcodes.
- Improve runtime performance.

## 6.1 Optimizations: Constant Folding

		PRINT_C	C-00000
		LOAD_C	R-00001 C-00001
1	print [1, 2, 3]	LOAD_C	R-00002 C-00002
2	a: int = 3	LPUSH_C	R-00002 C-00003
3	print [1, 2, a]	LPUSH_C	R-00002 C-00004
		LPUSH	R-00002 R-00001
	(i) Input program	PRINT	R-00002

(ii) Optimized bytecode generated

**Figure 10** – List constant folding

## 6.2 Optimizations: Register allocation

### PROBLEM

- How long is the value of a register needed?
- Can we re-use the registers?

### IMPLEMENTED

- Linear scan register allocation.

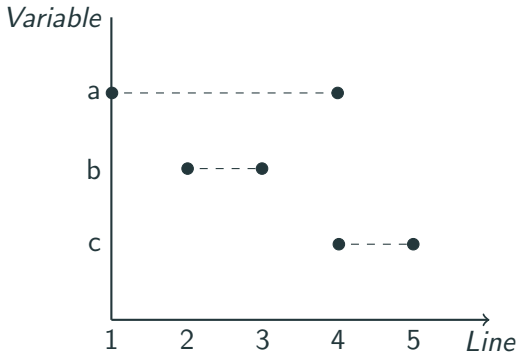

### IMPROVEMENT

- Significant memory reduction.

## 6.2 Optimizations: Register allocation

```
1  a: int = 10
2  b: int = 20
3  print a + b
4  c: int = a
5  print c
```

(i) Input program

(ii) Variable lifetime

**Figure 11** – Variable lifetime of a program

## 6.2 Optimizations: Register allocation

1	<b>a:</b> <b>int</b> = 10	LOAD_C	R-00000	C-00000
2	<b>b:</b> <b>int</b> = 20	LOAD_C	R-00001	C-00001
3	print a + b	ADD_INT	R-00001	R-00000 R-00001
4	<b>c:</b> <b>int</b> = a	PRINT	R-00001	
5	print c	MOVE	R-00001	R-00000
		PRINT	R-00001	

(i) Input program

(ii) Optimized bytecode generated

**Figure 12** – Register allocation optimization of a program

# Virtual Machine

---

## 7.1 Virtual Machine: Value Stack and Call stack

### Virtual Machine

Execute the bytecode instructions generated.

IMPLEMENTED

- A call stack.
- A value stack to pass parameters.
- Automatic call to the `main` function with `argv` argument.

## 7.1 Virtual Machine: Value Stack and Call stack

```
fun mul(a: int): int {  
    return a * 2  
}  
  
fun main(argv: [string]) {  
    print mul(10)  
}
```

(i) Input program

Call Stack

Value Stack

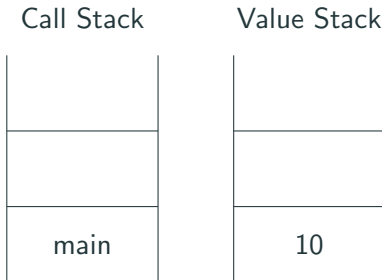

(ii) Stacks

}
```

(i) Input program

(ii) Stacks

**Figure 13** – Stack usage on program execution

# Application

---

## 8.1 Application: Job

### Application

Setup the application and fire up the virtual machine.

#### IMPLEMENTED

- Command line argument parsing.
- Extension to multiple application types (Prompt, stdin, File, etc.).
- Creation of the initial argv: `[string]` argument for the `main` function.

## Conclusions

---

## 9.1 Conclusions: General Objectives

### IN GENERAL

- Primary objectives completed.
- Competitive and performant interpreter.
- Benchmarking is hard.

### FURTHER EVOLUTION

- C foreign function interface (FFI).
- Proper I/O interface.
- Function overloading and generics.
- Extended standard library.
- Website (<https://nuua.io>) and package manager.

## 9.2 Conclusions: Curiosities

- 5k C++ lines.
- 2.3k C++ header lines.
- 1.4k Comment lines.
- 7.5k Total project lines.
- 500KB Total release binary size (Windows).
- Nuua is available for Linux and Windows under the MIT license at <http://nuua.io/latest>
